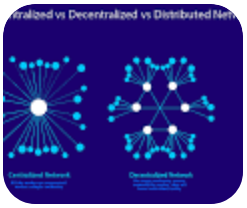
Aperçu généré par IA



A decentralized network is **a computer or communication structure where control, data, and decision-making are spread across multiple independent nodes or servers rather than being managed by a single central authority**. If one local node fails, the rest of the system keeps running. BLiNQ Networks +3

Key Features

- **No single point of failure:** The system avoids total collapse if one server stops.
- **Shared control:** Power is split among many independent users or devices.
- **Independent nodes:** Separate machines run local tasks and talk to each other. BLiNQ Networks +4

Network Types Compared

- **Centralized:** All data goes through one main server.
- **Decentralized:** Multiple sub-leaders or local hubs manage groups of users.
- **Distributed:** Every node is equal and directly connected to others. BLiNQ Networks +3

A clear look at how a decentralized model removes a single point of failure:
